```

Event=Alternative splicing, Named isoforms=3, Comment=Experimental confirmation may be lacking for some isoforms;

IsoId=Q9UHB6-2; Sequence=VSP\_003116; IsoId=Q9UHB6-1; Sequence=Displayed; Name=Alpha;

Isola-Q9UHB6-3; Sequence-VSP\_003117;
Note-No experimental confirmation available;
Notes No experimental confirmation available;
TISSUE SPECIFICITY: Highly expressed in placenta, kidney,
pancreas, prostate, ovary, spleen and heart. Also detected in
lung, liver, brain, skeletal muscle, thymus, testis and intestine.
Not detected in leukocytes. Eplin-beta levels are generally very
low. Eplin-alpha is abundant in epithelial cells from mammary
gland, prostate and in normal oral keratinocytes. Levels are low
in acrtic endothelial cells and dermal fibroblasts, and not

detectable in myocardia. The said defined introblasts, and not invocardia. The said most said in some cancer cell lines. Eplin-alpha is induced by serum. Eplin-beta is constitutively expressed. SIMILARITY: Contains I LIM zino-binding domain.

CAUTION: Ref. 4 (BAA91120) sequence differs from that shown due to a frameshift in position 697.

CAUTION: Ref. 5 sequence differs from that shown due to a frameshift shown due to frameshifts in positions 365 and 662. -------

Baltz R., Evrard D. Dossier in a pollen-specific protein.";

Plant Cell 4:1465-1466(1992)

-!- FUNCTION: COULD POSSIELY INVOLVED IN CONTROLLING POLLEN-SPECIFIC PROCESSES SUCH AS MALE GAMETE MATURATION, POLLEN TUBE FORMATION, OR EVEN FERTILIZATION.

-!- TISSUE SPECIFICITY: POLLEN.

-!- SIMILARITY: Contains 2 LIM zinc-binding domains.
                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.

Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: Structural component of the muscle. Milital ment to basement membrane and muscle cell membrane. UNC-89 responds to these signals, localizes, and then participates in assembling an M-line.

-! TISSUE SPECIFICITY: Localizes to the middle of A-bands.

-! SIMILARITY: Contains 1 DBL-homology (DH) domain.

-! SIMILARITY: Contains 49 immunoglobulin-like C2-type domains.

-! SIMILARITY: Contains 1 PH domain.

-! SIMILARITY: Contains 1 SRSD domains.

-! SIMILARITY: Contains 1 SRSD domains.

REGULATORY LIGHT CHAIN SUBUNITS (MLC.2).

DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Rattus norvegicus (Rat).

-!- FTW THERE ARE A NUMBER OF REPEATS OF THE TRIPEPTIDE K-S-P, NFM IS PHOSPHORYLATED ON A NUMBER OF THE SERINES IN THIS MOTIF. IT IS THOUGHT THAT PHOSPHORYLATION OF NFH RESULTS IN THE FORMATION OF INTERPLIAMENT CROSS BRIDGES THAT ARE IMPORTANT IN THE MAINTENANCE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               OF AXONAL CALIBER.

PTM: PHOSPHORYLATION SEEMS TO PLAY A MAJOR ROLE IN THE FUNCTIONING OF THE LARGER NEUROFILAMENT POLYPEPTIDES (NF-M AND NF-H), THE LEVELS OF PHOSPHORYLATION BEING ALTERED DEVELOPMENTALLY AND COINCIDENT WITH A CHANGE IN THE NEUROFILAMENT FUNCTION.

SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

New human lipid-associated proteins, nucleic acide, and antibodies, useful for diagnosis, treatment and prevention of e.g. cardiovascular disease

Claim 1; Page 76-77; 93pp; English.

Lipid-associated proteins (LIPAP) can be used for treating or preventing disorders associated with decreased expression of LIPAP, for screening for agonists or antagonists of LIPAP, and to raise specific antibodies. Antagonists and antagonists of LIPAP are useful for treating diseases associated with reduced or increased levels of LIPAP, actiovascular, neurological and gastrointessinal diseases and disorders of lipid metabolism. Fragments of the nucleic acid encoding LIPAP are useful for detection of full length coding sequences, in hybridization and/or amplification assays or for diagnosis or monitoring. Nucleotides encoding LIPAP are used to screen for compounds that specifically modify LIPAP expression, to screen for compounds that specifically modify LIPAP expression, therapeutic antisense, tripleotides contenting or ribozyme agents and for genomic mapping. Antibodies to the proteins are used for diagnosis and monitoring of LIPAP—associated disease by immunoassay, as antagonists, in competitive drug screens and for affinity purification of natural LIPAP.

This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a polypeptide described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypuclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as latherer's, Parkinson's disease, Huntington's disease, amyorrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotectic/chemokinetic activity, haemstatic and thrombolytic activity, chemotectic/chemokinetic activity, haemstatic and thrombolytic activity, arthritis and inflammation, leukaemias and C.N.S disorders.

tumor suppressor protein EPLIN, useful as a marker for diagnostic, mostic and therapeutic applications over the course of cell prognostic and therapeutic applications over t proliferative disorders associated with EPLIN

Claim 1; Page 44; 59pp; English.

The present sequence represents a human EPLIN (epithelial protein lost in neoplasm)-beta isoform. The specification also describes EPLIN-alpha.

EPLIN is a tumour suppressor protein, whose expression is altered in multiple common human tumour types. EPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to EPLIN nucleic acids, proteins or derivatives and thus have potential use as agonist or antagonist of EPLIN, in particular molecules that affect call proliferation. Thus the assays are useful for screening molecules with potential utility as anticancer drugs or lead compounds for drug development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polynucleotides are useful in gene therapy techniques. EPLIN is useful as a marker that can be diagnostically, prognostically and therapeutically used over the course of a cell proliferative disorder associated with EPLIN.

```

Human breast tumour-associated protein

08-DEC-1999

Claim 1; Page 43; 59pp; English

The present sequence represents a human EPLIN (epithelial protein lost in neoplasm) -dlpha isoform. The specification also describes EPLIN beta.

EPLIN is a tumour suppressor protein, whose expression is altered in multiple common human tumour types. EPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to EPLIN nucleic acids, proteins or derivatives and thus have potential use as agonist or antagonist of EPLIN, in particular molecules that affect cell proliferation. Thus the assays are useful for screening molecules with preential utility as anticaner drugs or lead compounds for drug development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polynucleotides are useful in gene therapy techniques. EPLIN is useful as a marker that can be diagnostically, prognostically and therapeutically used over the course of a cell proliferative disorder associated with EPLIN. protein lost in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonuclectide complementary to the complementary strand of a polynuclectide which comprises one of cliponuclectide comprises at least 15 nuclectides; or (b) a combination of an oligonuclectide comprises a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to a polynuclectide which comprises a 3'-end sequence complementary to a ligonuclectide which comprises a 3'-end sequence and the comprises a 1-end sequence; where the complementary to a perince of sequence is selected from those defined in the sylvaction. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynuclectides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers also well primers encoded by the full-length cDNAs. The primers also well and the protein second by ANH3631 to ANH3631 to ANH3631 to ANH3631 to ANH364 to ANH364 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 to ANH3640 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAB95893 represent human amino acid sequences, and AAH13629 to AAH13612 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ٠,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     457
```

```
The invention relates to a novel human sterol regulatory element binding protein 3 (hSREBP-3) expressed in human normal hypothalamic tissue and its coding sequence. Also described is the process for preparing the protein and nucleic acid sequence, and the method for detecting hSREBP-3
                                                                                                                                                                                                                                                                                                                                                 Cholesterol regulatory factor binding protein and its coding sequence

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, complements and in recombinant production of (II). The character and gene mapping, and in recombinant production of (II). The character and as a sake also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) and its binding mathbodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in capponable for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and compression and or produce data for this patent did not appear in the printed consisting the intention of the invention of the intention of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            378
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             208

HUMA-) HUMAN GENOME SCI INC

Komatsoulis G; Ruben SM, Rosen CA,

WPI; 2000-587661/55

Naw isolated nucleic acid molecules encoding 49 human secreted proteins used for preventing, treating or ameliorating medical conditions, for diagnosing pathological conditions or as food additives or preservatives

Disclosure, Page 412-413; 419pp, English.

human secreted proteins given in AAG59449 to AAG59497 encode the human secreted proteins given in AAB34092 to AAB34140. AAB34141 to AAB34161 represent human secreted polypeptide sequences and proteins conditions. Which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissue and cells the genes are expressed in. Examples of activities include: CC and cells the genes are expressed in. Examples of activities include: CC antiarthritic; immunosuppressive; antirhematic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; and vulnerary. The polynucleorides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, anbits, spoats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are dispnosed or treated include cancer of the breast or liver, cardiovascular disorders, ensproyensis, nervous system disorders, electrons caused by bacteria, viruses and fungi and ocular disorders, infections caused by also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to transplantation, for supporting cell culture of primary tissues, comparate tissues and in chemotaxis. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to respect to respect storage capabilities. AAC59410 to AAC59448 and AAB34091 represent sequences used to the exemplification of the present invention.

The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays

for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.

Agonists and antagonists to the antigens can be used to design nucleic pancreatic cancer antigen polynucleotides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic and anganostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to generate or prevent neural, immune system, muscular, reproductive, gastrointestinal pulmonary, cardiovascular, renal or proliferative disorders. AAC99212 to AAC99240 and AAB85467 represent cycliferative disorders. AAC99221 to AAC99240 and AAB85467 represent

New isolated nucleic acid molecules encoding 49 human secreted proteins used for preventing, treating or ameliorating medical conditions, for diagnosing pathological conditions or as food additives or

Disclosure; Page 411-412; 419pp; English

The polynucleotide sequences given in AACS9499 to AACS9497 encode the human secreted proteins given in AAB34092 to AAB34141 to AAB34161 represent human secreted polynpeptide sequences and proteins so homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissue and calls the genes are expressed in. Examples of activities include: CC and cells the genes are expressed in. Examples of activities include: CC antiarthritic; immunosuppressive; antitheumatic; antiproliferative; cytostatio; cardiant; vasoriopic; antitheumatic; antiproliferative; crebrotective; antibacterial; virucide; fungicide; ophthalmological; and vulnerary. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, arbbits; goats, horses, cats, dogs, chickens or sheep. They are also used to prevent, treat or ameliorate a medical condition or susceptibility to a ucondition. Disorders which are disorders e.g. neoplasms or cancer of the breast or liver, cardiovascular disorders, cerebrovascular disorders, angiogenesis, nervous system disorders, infections caused by bacteria, viruses and fungi and ocular disorders, infections caused by the used to aid wound hearling and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to transplantation, for supporting cell culture of primary tissues, to create the act of the preservative to increase storage storage capabilities. AACS9440 to AACS9448 and AAB34091 represent sequences used to the exemplification of the present invention.

```

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

ANNOTATION OF FEATURES

STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts. Repeats are identified using RepeatMasker (A. Smit and P. Green

unpublished.) for Human and Mouse sequences.
Genes and Region of sequence similarity are identified by BI (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to tEST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
